1. An Overview of the RISC ProofNavigator

2. Specifying Arrays

3. Verifying the Linear Search Algorithm

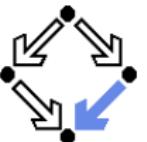

4. Conclusions

The RISC ProofNavigator

- An interactive proving assistant for program verification.
 - Research Institute for Symbolic Computation (RISC), 2005–:
<http://www.risc.uni-linz.ac.at/research/formal/software/ProofNavigator>.
 - Development based on prior experience with PVS (SRI, 1993–).
 - Kernel and GUI implemented in Java.
 - Uses external SMT (satisfiability modulo theories) solver.
 - CVCL (Cooperating Validity Checker Lite) 2.0.
 - Runs under Linux (only); freely available as open source (GPL).
- A language for the definition of logical theories.
 - Based on a strongly typed higher-order logic (with subtypes).
 - Introduction of types, constants, functions, predicates.
- Computer support for the construction of proofs.
 - Commands for basic inference rules and combinations of such rules.
 - Applied interactively within a sequent calculus framework.
 - Top-down elaboration of proof trees.

Designed for simplicity of use; applied to non-trivial verifications.

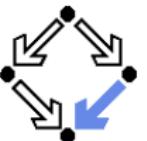

Using the Software

For survey, see “Program Verification with the RISC ProofNavigator”.

For details, see “The RISC ProofNavigator: Tutorial and Manual”.

- Develop a theory.
 - Text file with declarations of types, constants, functions, predicates.
 - Axioms (propositions assumed true) and formulas (to be proved).
- Load the theory.
 - File is read; declarations are parsed and type-checked.
 - Type-checking conditions are generated and proved.
- Prove the formulas in the theory.
 - Human-guided top-down elaboration of proof tree.
 - Steps are recorded for later replay of proof.
 - Proof status is recorded as “open” or “completed”.
- Modify theory and repeat above steps.
 - Software maintains dependencies of declarations and proofs.
 - Proofs whose dependencies have changed are tagged as “untrusted”.

Starting the Software

■ Starting the software:

ProofNavigator & (32 bit machines at RISC)
ProofNavigator64 & (64 bit machines at RISC)

■ Command line options:

Usage: ProofNavigator [OPTION]... [FILE]

FILE: name of file to be read on startup.

OPTION: one of the following options:

-n, --nogui: use command line interface.

-c, --context NAME: use subdir NAME to store context.

--cvcl PATH: PATH refers to executable "cvcl".

-s, --silent: omit startup message.

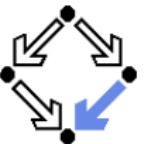

-h, --help: print this message.

■ Repository stored in subdirectory of current working directory:

.ProofNavigator/

■ Option -c *dir* or command newcontext "*dir*" :

■ Switches to repository in directory *dir*.

The Graphical User Interface

The Software Architecture

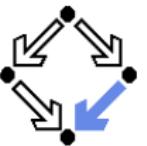

Software Components

- **Graphical user interface.**
 - Display of declarations and proof state.
 - Embeds HTML browser as core component.
- **Proof engine.**
 - Commands for navigating the proof.
 - Interaction with validity checker to simplify/close proof states.
- **Validity checker.**
 - Simplifies formulas
 - Checks the validity of formulas.
 - Produces counterexamples for (presumably) invalid formulas.
- **Object repository.**
 - Proof persistence.
 - Proof status management.

All data are externally represented in (gzipped) XML.

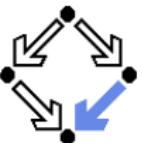

A Theory

```
% switch repository to "sum"
newcontext "sum";

% the recursive definition of the sum from 0 to n
sum: NAT->NAT;
S1: AXIOM sum(0)=0;
S2: AXIOM FORALL(n:NAT): n>0 => sum(n)=n+sum(n-1);

% proof that explicit form is equivalent to recursive definition
S: FORMULA FORALL(n:NAT): sum(n) = (n+1)*n/2;
```

Declarations written with an external editor in a text file.

Proving a Formula

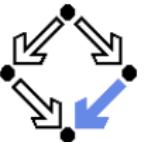

When the file is loaded, the declarations are pretty-printed:

- $\text{sum} \in \mathbb{N} \rightarrow \mathbb{N}$
- $\text{axiom } S1 \equiv \text{sum}(0) = 0$
- $\text{axiom } S2 \equiv \forall n \in \mathbb{N}: n > 0 \Rightarrow \text{sum}(n) = n + \text{sum}(n-1)$
- $S \equiv \forall n \in \mathbb{N}: \text{sum}(n) = \frac{(n+1) \cdot n}{2}$

The proof of a formula is started by the `prove` command.

Formula S

prove S: Construct Proof
proof S: Show Proof
formula S: Print Formula

Proving a Formula

- Proof of formula F is represented as a tree.
 - Each tree node denotes a proof state (goal).
 - Logical sequent:
 $A_1, A_2, \dots \vdash B_1, B_2, \dots$
 - Interpretation:
 $(A_1 \wedge A_2 \wedge \dots) \Rightarrow (B_1 \vee B_2 \vee \dots)$
 - Initially single node $Axioms \vdash F$.
- The tree must be expanded to completion.
 - Every leaf must denote an obviously valid formula.
 - Some A_i is false or some B_j is true.
- A proof step consists of the application of a proving rule to a goal.
 - Either the goal is recognized as true.
 - Or the goal becomes the parent of a number of children (subgoals).
The conjunction of the subgoals implies the parent goal.

$$\begin{array}{c} \text{Constants: } x_0 \in S_0, \dots \\ [L_1] \quad A_1 \\ \dots \\ [L_n] \quad A_n \\ \hline [L_{n+1}] \quad B_1 \\ \dots \\ [L_{n+m}] \quad B_m \end{array}$$

An Open Proof Tree

Proof Tree

- ▽ [tca]: induction n in byu
- [dbj]: proved (CVCL)
- [ebj]

Formula [S] proof state [dbj]

Constants (with types): sum.

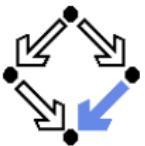

lxe $\forall n \in \mathbb{N}: n > 0 \Rightarrow \text{sum}(n) = n + \text{sum}(n-1)$

d3i $\text{sum}(0) = 0$

nfq $\text{sum}(0) = \frac{(0+1)\cdot 0}{2}$

Parent: [tca]

Closed goals are indicated in blue; goals that are open (or have open subgoals) are indicated in red. The red bar denotes the “current” goal.

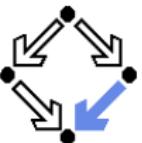

A Completed Proof Tree

- Proof Tree

- ▽ [tca]: induction n in byu
 - [dbj]: proved (CVCL)
- ▽ [ebj]: instantiate n_0+1 in lxe
 - [k5f]: proved (CVCL)

The visual representation of the complete proof structure; by clicking on a node, the corresponding proof state is displayed.

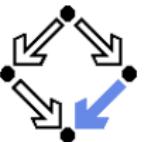

Navigation Commands

Various buttons support navigation in a proof tree.

- : **prev**
 - Go to previous open state in proof tree.
- : **next**
 - Go to next open state in proof tree.
- : **undo**
 - Undo the proof command that was issued in the parent of the current state; this discards the whole proof tree rooted in the parent.
- : **redo**
 - Redo the proof command that was previously issued in the current state but later undone; this restores the discarded proof tree.

Single click on a node in the proof tree displays the corresponding state;
double click makes this state the current one.

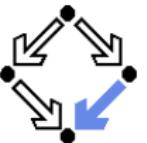

Proving Commands

The most important proving commands can be also triggered by buttons.

-  (scatter)
 - Recursively applies decomposition rules to the current proof state and to all generated child states; attempts to close the generated states by the application of a validity checker.
-  (decompose)
 - Like scatter but generates a single child state only (no branching).
-  (split)
 - Splits current state into multiple children states by applying rule to current goal formula (or a selected formula).
-  (auto)
 - Attempts to close current state by instantiation of quantified formulas.
-  (autostar)
 - Attempts to close current state and its siblings by instantiation.

Automatic decomposition of proofs and closing of proof states.

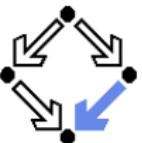

Proving Commands

More commands can be selected from the menus.

- **assume**
 - Introduce a new assumption in the current state; generates a sibling state where this assumption has to be proved.
- **case:**
 - Split current state by a formula which is assumed as true in one child state and as false in the other.
- **expand:**
 - Expand the definitions of denoted constants, functions, or predicates.
- **lemma:**
 - Introduce another (previously proved) formula as new knowledge.
- **instantiate:**
 - Instantiate a universal assumption or an existential goal.
- **induction:**
 - Start an induction proof on a goal formula that is universally quantified over the natural numbers.

Here the creativity of the user is required!

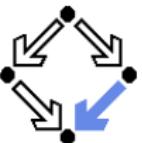

Auxiliary Commands

Some buttons have no command counterparts.

- **counterexample**
 - Generate a “counterexample” for the current proof state, i.e. an interpretation of the constants that refutes the current goal.
- - Abort current prover activity (proof state simplification or counterexample generation).
- - Show menu that lists all commands and their (optional) arguments.

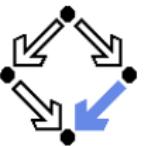

More facilities for proof control.

Proving Strategies

- Initially: semi-automatic proof decomposition.
 - expand expands constant, function, and predicate definitions.
 - scatter aggressively decomposes a proof into subproofs.
 - decompose simplifies a proof state without branching.
 - induction for proofs over the natural numbers.
- Later: critical hints given by user.
 - assume and case cut proof states by conditions.
 - instantiate provide specific formula instantiations.
- Finally: simple proof states are yielded that can be automatically closed by the validity checker.
 - auto and autostar may help to close formulas by the heuristic instantiation of quantified formulas.

Appropriate combination of semi-automatic proof decomposition, critical hints given by the user, and the application of a validity checker is crucial.

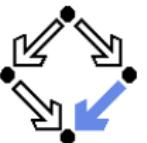

1. An Overview of the RISC ProofNavigator

2. Specifying Arrays

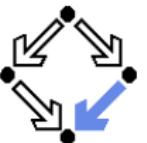

3. Verifying the Linear Search Algorithm

4. Conclusions

A Constructive Definition of Arrays

```
% constructive array definition      % the array operations
newcontext "arrays2";                  length: ARR -> INDEX =
                                         LAMBDA(a:ARR): a.0;
                                         new: INDEX -> ARR =
                                         LAMBDA(n:INDEX): (n, any);
                                         put: (ARR, INDEX, ELEM) -> ARR =
                                         LAMBDA(a:ARR, i:INDEX, e:ELEM):
                                         IF i < length(a)
                                         THEN (length(a),
                                               content(a) WITH [i]:=e)
                                         ELSE anyarray
                                         ENDIF;
                                         get: (ARR, INDEX) -> ELEM =
                                         LAMBDA(a:ARR, i:INDEX):
                                         IF i < length(a)
                                         THEN content(a)[i]
                                         ELSE anyelem ENDIF;
                                         content:          % a selector operation
                                         ARR -> (ARRAY INDEX OF ELEM) =
                                         LAMBDA(a:ARR): a.1;
```

A Program Verification

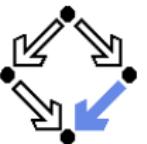

Verification of the following Hoare triple:

$$\{olda = a \wedge oldx = x \wedge n = |a| \wedge i = 0 \wedge r = -1\}$$

```
while  $i < n \wedge r = -1$  do
    if  $a[i] = x$ 
        then  $r := i$ 
        else  $i := i + 1$ 
```

$$\{a = olda \wedge x = oldx \wedge ((r = -1 \wedge \forall i : 0 \leq i < |a| \Rightarrow a[i] \neq x) \vee (0 \leq r < |a| \wedge a[r] = x \wedge \forall i : 0 \leq i < r \Rightarrow a[i] \neq x))\}$$

Find the smallest index r of an occurrence of value x in array a ($r = -1$, if x does not occur in a).

The Verification Conditions

$A : \Leftrightarrow Input \Rightarrow Invariant$

$B_1 : \Leftrightarrow Invariant \wedge i < n \wedge r = -1 \wedge a[i] = x \Rightarrow Invariant[i/r]$

$B_2 : \Leftrightarrow Invariant \wedge i < n \wedge r = -1 \wedge a[i] \neq x \Rightarrow Invariant[i+1/i]$

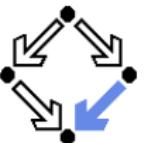

$C : \Leftrightarrow Invariant \wedge \neg(i < n \wedge r = -1) \Rightarrow Output$

$Input : \Leftrightarrow olda = a \wedge oldx = x \wedge n = length(a) \wedge i = 0 \wedge r = -1$

$Output : \Leftrightarrow a = olda \wedge x = oldx \wedge$
 $((r = -1 \wedge \forall i : 0 \leq i < length(a) \Rightarrow a[i] \neq x) \vee$
 $(0 \leq r < length(a) \wedge a[r] = x \wedge \forall i : 0 \leq i < r \Rightarrow a[i] \neq x))$

$Invariant : \Leftrightarrow olda = a \wedge oldx = x \wedge n = length(a) \wedge$
 $0 \leq i \leq n \wedge \forall j : 0 \leq j < i \Rightarrow a[j] \neq x \wedge$
 $(r = -1 \vee (r = i \wedge i < n \wedge a[r] = x))$

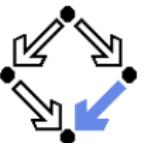

The verification conditions A, B_1, B_2, C have to be proved.

The Verification Conditions

```
newcontext      Input: BOOLEAN = olda = a AND oldx = x AND
    "linsearch";      n = length(a) AND i = 0 AND r = -1;

% declaration      Output: BOOLEAN = a = olda AND
% of arrays          ((r = -1 AND
...                  (FORALL(j:NAT): j < length(a) =>
            get(a,j) /= x)) OR
a: ARR;           (0 <= r AND r < length(a) AND get(a,r) = x AND
olda: ARR;         (FORALL(j:NAT):
x: ELEM;           j < r => get(a,j) /= x)));
oldx: ELEM;
i: NAT;
n: NAT;
r: INT;
Invariant: (ARR, ELEM, NAT, NAT, INT) -> BOOLEAN =
LAMBDA(a: ARR, x: ELEM, i: NAT, n: NAT, r: INT):
olda = a AND oldx = x AND
n = length(a) AND i <= n AND
(FORALL(j:NAT): j < i => get(a,j) /= x) AND
(r = -1 OR (r = i AND i < n AND get(a,r) = x));
...
```

The Verification Conditions (Contd)

...

A: FORMULA

Input \Rightarrow Invariant(a, x, i, n, r);

B1: FORMULA

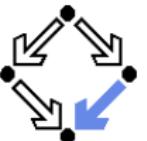

Invariant(a, x, i, n, r) AND i < n AND r = -1 AND get(a,i) = x
 \Rightarrow Invariant(a,x,i,n,i);

 - 4. Conclusions**

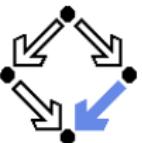

Conclusions

So what does this experience show us?

- Parts of a verification can be handled quite automatically:
 - Top-down proof decomposition.
 - Propositional logic reasoning.
 - Equality reasoning.
 - Linear arithmetic.
- Manual control for crucial “creative steps”
 - Expansion of definitions.
 - Proof cuts by assumptions/case distinctions.
 - Application of additional lemmas.
 - Instantiation of quantified formulas.

Proving assistants can do the essentially simple but usually tedious parts of the proof; the human nevertheless has to provide the creative insight.

Popular Proving Assistants

- **PVS:** <http://pvs.csl.sri.com>
 - SRI (Software Research Institute) International, Menlo Park, CA.
 - Integrated environment for developing and analyzing formal specs.
 - Core system is implemented in Common Lisp.
 - Emacs-based frontend with Tcl/Tk-based GUI extensions.
- **Isabelle/HOL:** <http://isabelle.in.tum.de>
 - University of Cambridge and Technical University Munich.
 - Isabelle: generic theorem proving environment (aka “proof assistant”).
 - Isabelle/HOL: instance that uses higher order logic as framework.
 - Decisions procedures, tactics for interactive proof development.
- **Coq:** <http://coq.inria.fr>
 - LogiCal project, INRIA, France.
 - Formal proof management system (aka “proof assistant”).
 - “Calculus of inductive constructions” as logical framework.
 - Decision procedures, tactics support for interactive proof development.
